Flex ✓ Check™ Product Summary

A Comprehensive software system for processing criminal background checks From multiple sources. The system can process and track submissions from Live Scan devices for criminal and applicant fingerprint-based checks. It can also process and track Firearms Instant Check submissions from dealers through an integrated Web site.

A powerful Disposition Processor module allows for the processing of multiple sources of subject data and the determination and disposition of the results. It performs appropriate queries against State, Federal and internal databases for the type of subject, source and submitter.

Results that include hits are placed into work queues for analysts to complete. Clean background results may be returned immediately by several methods, determined by the Transaction Type in table set-up parameters. Among those methods are formatted email, formatted letter, web results screen, special interface, law enforcement administrative message or report.
